Fasoo RiskView

Prevent insider threats that are real but difficult to detect

The risk of insider threats exists in any company in any sizes. Security solutions cannot always rule out the insider threats, even though it can help lessen the probability to some extent. This is largely because it is difficult to detect insider threats, since insiders have legitimate access to data with intimate knowledge of security controls and methods to bypass them.

Fasoo RiskView, a comprehensive log monitoring and analysis solution, can help prevent insider threats. Leveraging audit trails from various established security systems, the solution enables organizations to identify, prioritize and monitor possible risk of insider threats in a centralized manner.
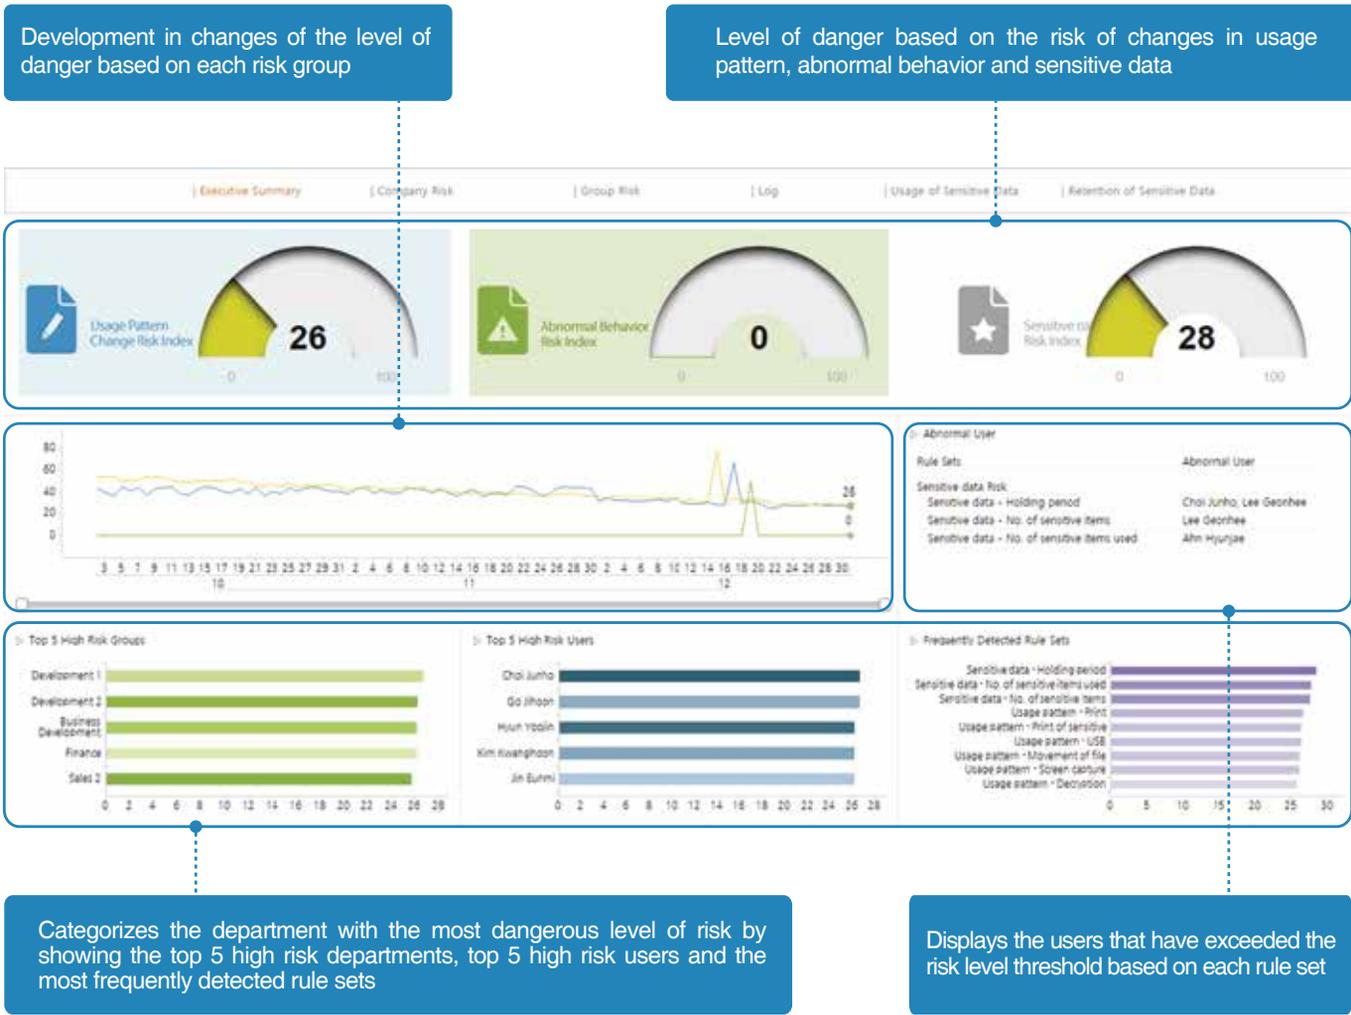

Involve line managers with your risk management practices

In general, security administrators take on roles of security risk management. However, line managers on the front line of security risks are also required to review and respond to the risks pertaining to their people, jobs and data. Fasoo RiskView is designed to provide line managers with comprehensive risk index results which alert them to potential risks and help them prevent risks. All findings can be communicated to the relevant line managers from security administrators for an in-depth review. By involving line managers with this risk review process, organizations can determine with confidence whether the target users, groups or files are truly subject to insider threats.

Monitor insider threats through correlation based log analytics

Fasoo RiskView allows organizations to monitor insider threats, through correlation based log analytics. It calculates and displays the risk index through dynamically collecting and analyzing audit trails from a variety of security systems including DRM/IRM, DLP, IPS, physical access control, database security, and many more. Unlike many other log analysis solutions, Fasoo RiskView can monitor and analyze logs on data layer besides network and system layers. In addition, employee attendance/access information and other types of employee HR data can also be associated with the audit trails derived from various systems to discover any suspicious behaviors. The results are readily traceable and visualized using the risk index, trending charts and lists in the Web-based management console.

Fasoo RiskView

Development in changes of the level of danger based on each risk group

Level of danger based on the risk of changes in usage pattern, abnormal behavior and sensitive data

Categorizes the department with the most dangerous level of risk by showing the top 5 high risk departments, top 5 high risk users and the most frequently detected rule sets

Displays the users that have exceeded the risk level threshold based on each rule set

"Now with all of our information on all file usage in addition to other HR data, Fasoo can help us determine realistic risks within our organization. By compiling all of the information together and analyzing the data based on its realistic risk level, we can mitigate insider threat."
